animals in that breed. EPD's are expressed in plus or minus pounds for growth traits (birth, weaning and yearling). Milk is expressed in pounds of weaning weight increase due to increase milking ability. Accuracy (ACC) is an expression of reliability of the EPD and can range from 0.0 to 1.0. The higher the accuracy the more reliable is the EPD.

EPD Value	Birth		Weaning wt		Yearling		Milk		CED	
	EPD	ACC	EPD	ACC	EPD	ACC	EPD	ACC	EPD	ACC
	+2.0	.50	+12	.45	+35	.47	+9	.20	+4	.05

Birth Weight - calves of this sire can be expected on the average to weigh 2.0 pounds more at birth than calves sired by a bull with an EPD of 0.0.

Weaning Weight - calves sired by this bull should have a 12 pound advantage in weaning weight compared to calves sired by a bull with an EPD for weaning weight of 0.0.

Yearling Weight - This sire's progeny should be on the average 35 pounds heavier at 365 days of age than those sired by a bull with an EPD of 0.0 for yearling weight.

Milk - The milking ability of a sire's daughters expressed in pounds of calf weaned. It predicts the differences in average weaning weight of a sire's daughters progeny due to milking ability. Daughters of this bull should have a positive effect on their calve's weaning weight due to their milking ability equal to 9 pounds more than daughters of a bull with a maternal milk EPD of 0.0.

Calving Ease Direct (CED) - Predicts the average differences in percentages in ease with which a sire's calves will be born when bred to first calf heifers. Higher values indicate greater calving ease. CE EPDs are based on calving ease scores and birth weights. This bull's calves would be expected to be born with 4% less calving difficulty to first calf heifers than calves by a bull with a 0.0 CED EPD.
